

NCP456R

2 A Single Load Switch for Low Voltage Rail

The NCP456R is a power load switch with very low R_{on} NMOSFET controlled by external logic pin, allowing optimization of battery life, and portable device autonomy.

Indeed, thanks to a best in class current consumption optimization with NMOS structure, leakage currents are drastically decreased. Offering optimized leakages isolation on the ICs connected on the battery.

Reverse voltage protection, from OUT to IN is offered in the NCP456R.

Proposed in wide input voltage range from 0.75 V to 5.5 V, and a very small CSP6 0.85 x 1.25 mm².

Features

- 0.75 V – 5.5 V Operating Range
- 24 mΩ N MOSFET
- Vbias Rail Input
- DC Current up to 2 A
- Reverse Blocking Option
- Active High EN Pin
- CSP6, 0.85 x 1.25 mm², Pitch 0.4 mm
- These Devices are Pb-Free and are RoHS Compliant

Typical Applications

- Notebooks
- Tablets
- Wireless
- Mobile Phones
- Digital Cameras

MAXIMUM RATINGS

Rating	Symbol	Value	Unit
IN, OUT, EN, VBIAS, GATE Pins: (Note 1)	$V_{EN}, V_{IN}, V_{OUT}, V_{BIAS}, V_{GATE}$	-0.3 to + 6.5	V
From IN to OUT Pins: Input/Output (Note 1)	V_{IN}, V_{OUT}	±6.5	V
Human Body Model (HBM) ESD Rating are (Note 2)	ESD HBM	2000	V
Machine Model (MM) ESD Rating are (Note 2)	ESD MM	200	V
Latch-up Protection (Note 3) Pins IN, OUT, EN, VBIAS and GATE	LU	100	mA
Maximum Junction Temperature	T_J	-40 to + 125	°C
Storage Temperature Range	T_{STG}	-40 to + 150	°C
Moisture Sensitivity (Note 4)	MSL	Level 1	

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

- According to JEDEC standard JESD22-A108.
- This device series contains ESD protection and passes the following tests:
Human Body Model (HBM) ±2.0 kV per JEDEC standard: JESD22-A114 for all pins.
Machine Model (MM) ±250 V per JEDEC standard: JESD22-A115 for all pins.
- Latch up Current Maximum Rating: ±100 mA per JEDEC standard: JESD78 class II.
- Moisture Sensitivity Level (MSL): 1 per IPC/JEDEC standard: J-STD-020.

OPERATING CONDITIONS

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{IN}	Operational Power Supply		0.75		5.5	V
V_{EN}	Enable Voltage		0		5.5	V
V_{BIAS}	Bias voltage ($V_{BIAS} \geq \text{best of } V_{IN}, V_{out}$)		1.2		5.5	V
T_A	Ambient Temperature Range		-40	25	+85	°C
C_{IN}	Decoupling input capacitor		100			nF
C_{OUT}	Decoupling output capacitor		100			nF
$R_{\theta JA}$	Thermal Resistance Junction to Air	CSP6 (Note 5)		100		°C/W
I_{OUT}	Maximum DC current				2	A
P_D	Power Dissipation Rating	(Note 6)		0.2		W

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

- The $R_{\theta JA}$ is dependent of the PCB heat dissipation and thermal via.
- The maximum power dissipation (P_D) is given by the following formula:

$$P_D = \frac{T_{JMAX} - T_A}{R_{\theta JA}}$$

NCP456R

ELECTRICAL CHARACTERISTICS Min & Max Limits apply for T_A between -40°C to $+85^{\circ}\text{C}$ for V_{IN} and V_{BIAS} between 0.75 V to 5.5 V (Unless otherwise noted). Typical values are referenced to $T_A = +25^{\circ}\text{C}$, $V_{IN} = 3.3\text{ V}$ and $V_{BIAS} = 5\text{ V}$ (Unless otherwise noted).

FUNCTIONAL DESCRIPTION

Overview

The NCP456R is a high side N Channel MOSFET power distribution switch designed to isolate ICs connected on the battery or DCDC supplies in order to save energy. The part can be used with a wide range of supply from 0.75 V to 5.5 V.

Enable input

Enable pin is an active high. The path is opened when EN pin is tied low (disable), forcing NMOS switch off.

The IN/OUT path is activated with a minimum of $V_{BIAS} \geq \text{best of } V_{IN}, V_{OUT} = 0.75 \text{ V}$ and EN forced to high level.

 V_{BIAS} Rail

The core of the IC is supplied due to V_{BIAS} supply rail (common +5 V, 3.3 V, 1.8 V, 1.2 V ...etc). Indeed, no current consumption is used on IN pin, allowing to improve power saving of the rail that must be isolated by the power switch.

If V_{bias} rail is not available or used, V_{bias} pin and V_{in} pin can be connected together as close as possible the DUT.

Output Rise Time – Gate Control

The NMOS is control with internal charge pump and driver. A minimum gate slew rate is internally set to avoid

huge inrush current when EN is set from low to high. The default gate slew rate depends on V_{in} level. The higher V_{in} level, the longer rise time.

In addition, an external capacitor can be connected between Gate pin and GND in order to slow down the gate rising. See electrical table for more details.

 C_{in} and C_{out} Capacitors

100 nF external capacitors must be connected as close as possible the DUT for noise immunity and better stability. In case of input hot plug (input voltage connected with fast slew rate – few μs – it's strongly recommended to avoid big capacitor connected on the input. That allows to avoid input over voltage transients.

Reverse Blocking Control

A reverse blocking control circuitry is embedded to eliminate leakages from OUT to IN in case of $V_{out} > V_{in}$.

A comparator measures the dropout voltage on the switch between OUT and IN and turn off the NMOS if this voltage exceeds specified reverse voltage. This comparator is available whatever the EN pin level.

APPLICATION INFORMATION

Power Dissipation

Main contributor in term of junction temperature is the power dissipation of the power MOSFET. Assuming this, the power dissipation and the junction temperature in normal mode can be calculated with the following equations:

$$P_D = R_{DS(on)} \times (I_{out})^2 \quad (\text{eq. 1})$$

P_D = Power dissipation (W)
 $R_{DS(on)}$ = Power MOSFET on resistance (Ω)
 I_{out} = Output current (A)

$$T_J = R_D \times R_{\theta JA} + T_A \quad (\text{eq. 2})$$

T_J = Junction temperature ($^{\circ}\text{C}$)
 $R_{\theta JA}$ = Package thermal resistance ($^{\circ}\text{C/W}$)
 T_A = Ambient temperature ($^{\circ}\text{C}$)

Demoboard

The NCP456R integrates a 2 A rated NMOS FET, and the PCB rules must be respected to properly evacuate the heat out of the silicon.

The package is a CSP and due to the low thermal resistance of the silicon, all the balls can be used to improved power dissipation. Indeed, even if the power crosses the IN / OUT pins only, all the balls around this power area should be connected to the larger PCB area.

In the below PCB example (application demonstration board), all the PCB areas connected to 6 balls are enlarged. In addition vias are connected to bottom side with exactly same form factor of the other PCB side.

Additional improvements can be done also by using more copper thickness and the thinner epoxy as possible.
