

NLSX3014

4-Bit 100 Mb/s Configurable Dual-Supply Level Translator

The NLSX3014 is a 4-bit configurable dual-supply bidirectional level translator without a direction control pin. The I/O V_{CC} and I/O V_L ports are designed to track two different power supply rails, V_{CC} and V_L respectively. The V_{CC} supply rail is configurable from 1.3 V to 4.5 V while the V_L supply rail is configurable from 0.9 V to ($V_{CC} - 0.4$) V. This allows lower voltage logic signals on the V_L side to be translated into higher voltage logic signals on the V_{CC} side, and vice-versa. Both I/O ports are auto-sensing; thus, no direction pin is required.

The Output Enable (EN) input, when Low, disables both I/O ports by putting them in 3-state. This significantly reduces the supply currents from both V_{CC} and V_L . The EN signal is designed to track V_L .

Features

- Wide High-Side V_{CC} Operating Range: 1.3 V to 4.5 V
Wide Low-Side V_L Operating Range: 0.9 V to ($V_{CC} - 0.4$) V
- High-Speed with 100 Mb/s Guaranteed Data Rate for $V_L > 1.6$ V
- Low Bit-to-Bit Skew
- Overvoltage Tolerant Enable and I/O Pins
- Non-preferential Powerup Sequencing
- Small packaging: 1.7 mm x 2.0 mm UQFN12
- This is a Pb-Free Device

Typical Applications

- Mobile Phones, PDAs, Other Portable Devices

1. Normal test conditions are V_{EN} = 0 V, C_{I/OVCC} = 15 pF and C_{I/OVL} = 15 pF, unless otherwise specified.
2. V_{CC} is the supply voltage associated with the high voltage port, and V_{CC} ranges from +1.3 V to 4.5 V under normal operating conditions.
3. V_L is the supply voltage associated with the low voltage port. V_L must be less than or equal to (V_{CC} - 0.4) V during normal operation. However, during startup and shutdown conditions, V_L can be greater than (V_{CC} - 0.4) V.
4. Typical values are for V_{CC} = +2.8 V, V_L = +1.8 V and T_A = +25°C. All units are production tested at T_A = +25°C. Limits over the operating temperature range are guaranteed by design.

IMPORTANT APPLICATIONS INFORMATION

Level Translator Architecture

The NLSX3014 auto sense translator provides bi-directional voltage level shifting to transfer data in multiple supply voltage systems. This device has two supply voltages, V_L and V_{CC} , which set the logic levels on the input and output sides of the translator. When used to transfer data from the V_L to the V_{CC} ports, input signals referenced to the V_L supply are translated to output signals with a logic level matched to V_{CC} . In a similar manner, the V_{CC} to V_L translation shifts input signals with a logic level compatible to V_{CC} to an output signal matched to V_L .

The NLSX3014 consists of four bi-directional channels that independently determine the direction of the data flow without requiring a directional pin. The one-shot circuits are used to detect the rising or falling input signals. In addition, the one shots decrease the rise and fall time of the output signal for high-to-low and low-to-high transitions.

Input Driver Requirements

For proper operation, the input driver to the auto sense translator should be capable of driving 2.0 mA of peak output current.

Output Load Requirements

The NLSX3014 is designed to drive CMOS inputs. Resistive pullup or pulldown loads of less than 50 k Ω should not be used with this device. The NLSX3373 or NLSX3378 open-drain auto sense translators are alternate translator options for an application such as the I²C bus that requires pullup resistors.

Enable Input (EN)

The NLSX3014 has an Enable pin (EN) that provides tri-state operation at the I/O pins. Driving the Enable pin to a low logic level minimizes the power consumption of the device and drives the I/O V_{CC} and I/O V_L pins to a high impedance state. Normal translation operation occurs when the EN pin is equal to a logic high signal. The EN pin

is referenced to the V_L supply and has Over-Voltage Tolerant (OVT) protection.

Uni-Directional versus Bi-Directional Translation

The NLSX3014 can function as a non-inverting uni-directional translator. One advantage of using the translator as a uni-directional device is that each I/O pin can be configured as either an input or output. The configurable input or output feature is especially useful in applications such as SPI that use multiple uni-directional I/O lines to send data to and from a device. The flexible I/O port of the auto sense translator simplifies the trace connections on the PCB.

Power Supply Guidelines

It is recommended that the V_L supply should be less than or equal to the value of the V_{CC} minus 0.4 V. The sequencing of the power supplies will not damage the device during the power up operation; however, the current consumption of the device will increase if V_L exceeds V_{CC} minus 0.4 V. The Enable (EN) pin can be used to provide power savings. Both I/O ports are tri-stated and in low power consumption state if the EN input equals 0 V.

The enable pin should be used to enter the low current tri-state mode, rather than setting either the V_L or V_{CC} supplies to 0 V. The NLSX3014 will not be damaged if either V_L or V_{CC} is equal to 0 V while the other supply voltage is at a nominal operating value; however, the operation of the translator cannot be guaranteed during single supply operation.

For optimal performance, 0.01 to 0.1 μ F decoupling capacitors should be used on the V_L and V_{CC} power supply pins. Ceramic capacitors are a good design choice to filter and bypass any noise signals on the power supply voltage lines to the ground plane of the PCB. The noise immunity will be maximized by placing the capacitors as close as possible to the supply and ground pins, along with minimizing the PCB connection traces.
