

# Octal D-Type Flip-Flop with 3-STATE Outputs

## **74VHCT574A**

## **General Description**

The VHCT574A is an advanced high speed CMOS octal flip–flop with 3–STATE output fabricated with silicon gate CMOS technology. It achieves the high speed operation similar to equivalent Bipolar Schottky TTL while maintaining the CMOS low power dissipation. This 8–bit D–type flip– flop is control led by a clock input (CP) and an Output Enable input  $(\overline{OE})$ . When the  $\overline{OE}$  input is HIGH, the eight outputs are in a high impedance state.

Protection circuits ensure that 0 V to 5.5 V can be applied to the input and output (Note 1) pins without regard to the supply voltage. This device can be used to interface 3 V to 5 V systems and two supply systems such as battery back up. This circuit prevents device destruction due to mismatched supply and input voltages.

#### NOTE:

1. Outputs in OFF–State.

#### **Features**

- High Speed:  $f_{MAX} = 140 \text{ MHz}$  (Typ) at  $T_A = 25^{\circ}\text{C}$
- Power Down Protection is Provided on All Inputs and Outputs
- Low Noise:  $V_{OLP} = 1.6 \text{ V (Max)}$
- Low Power Dissipation:  $I_{CC} = 4 \mu A \text{ (Max)} @ T_A = 25 ^{\circ}C$
- Pin and Function Compatible with 74HCT574
- This is a Pb-Free Device

#### **Functional Description**

The VHCT574A consists of eight edge–triggered flip–flops with individual D–type inputs and 3–STATE true outputs. The buffered clock and buffered Output Enable are common to all flip–flops. The eight flip–flops will store the state of their individual D inputs that meet the setup and hold time requirements on the LOW–to–HIGH Clock (CP) transition. With the Output Enable ( $\overline{OE}$ ) LOW, the contents of the eight flip–flops are available at the outputs. When the  $\overline{OE}$  is HIGH, the outputs go to the high impedance state. Operation of the  $\overline{OE}$  input does not affect the state of the flip–flops.

 C<sub>PD</sub> is defined as the value of the internal equivalent capacitance which is calculated from the operating current consumption without load. Average operating current can be obtained by the equation: I<sub>CC</sub> (opr.) = C<sub>PD</sub> x V<sub>CC</sub> x f<sub>IN</sub> + I<sub>CC</sub>/8 (per F/F). The total C<sub>PD</sub> when n pcs. of the Octal D Flip–Flop operates can be calculated by the equation: C<sub>PD</sub> (total) = 20 + 12n.
