Description

The MC10/100EP451 is a 6−bit fully differential register with common clock and single−ended Master Reset (MR). It is ideal for very high frequency applications where a registered data path is necessary.

All inputs have a 75 kΩ pulldown resistor internally. Differential inputs have an override clamp. Unused differential register inputs can be left open and will default LOW. When the differential inputs are forced to < V_{EE} + 1.2 V, the clamp will override and force the output to a default state. When in the default state, and since the flip−flop is edge triggered, the output reaches a determined, but not predicted, valid state.

The positive transition of CLK (pin 4) will latch the registers. Master Reset (MR) HIGH will asynchronously reset all registers forcing Q outputs to go LOW.

The 100 Series contains temperature compensation.

Features

- 450 ps Typical Propagation Delay
- Maximum Frequency > 3.0 GHz Typical
- Asynchronous Master Reset
- 20 ps Skew Within Device, 35 ps Skew Device−To−Device
- PECL Mode Operating Range: V_{CC} = 3.0 V to 5.5 V
  With V_{EE} = 0 V
- NECL Mode Operating Range: V_{CC} = 0 V
  With V_{EE} = −3.0 V to −5.5 V
- Open Input Default State
- Safety Clamp on Inputs
- These Devices are Pb−Free and are RoHS Compliant
