

NCP1588, NCP1589

Low Voltage Synchronous Buck Controller

The NCP158x is a low cost PWM controller designed to operate from a 5 V or 12 V supply. This device is capable of producing an output voltage as low as 0.8 V. This device is capable of converting voltage from as low as 2.5 V. This 10-pin device provides an optimal level of integration to reduce size and cost of the power supply. Features include a 1.5 A gate driver design and an internally set 300 kHz oscillator. In addition to the 1.5 A gate drive capability, other efficiency enhancing features of the gate driver include adaptive non-overlap circuitry. The NCP158x also incorporates an externally compensated error amplifier. Protection features include programmable short circuit protection and undervoltage lockout (UVLO).

Features

- V_{CC} Range from 4.5 to 13.2 V
- 300 kHz Internal Oscillator
- Boost Pin Operates to 26.4 V
- Voltage Mode PWM Control
- Precision 0.8 V Internal Reference
- Adjustable Output Voltage
- Internal 1.5 A Gate Drivers
- 80% Max Duty Cycle
- Input Under Voltage Lockout
- Programmable Current Limit
- This is a Pb-Free Device

Applications

- Graphics Cards
- Desktop Computers
- Servers / Networking
- DSP & FPGA Power Supply
- DC-DC Regulator Modules

PIN FUNCTION DESCRIPTION

Pin No.	Symbol	Description
1	BOOT	Supply rail for the floating top gate driver. To form a boost circuit, use an external diode to bring the desired input voltage to this pin (cathode connected to BOOT pin). Connect a capacitor (C_{BOOT}) between this pin and the LX pin. Typical values for C_{BOOT} range from 0.1 μ F to 1 μ F. Ensure that C_{BOOT} is placed near the IC.
2	LX	Switch node pin. This is the reference for the floating top gate driver. Connect this pin to the source of the top MOSFET.
3	UG	Top gate MOSFET driver pin. Connect this pin to the gate of the top N-channel MOSFET.
4	LG	Bottom gate MOSFET driver pin. Connect this pin to the gate of the bottom N-channel MOSFET.
5	GND	IC ground reference. All control circuits are referenced to this pin.
6	V_{CC}	Supply rail for the internal circuitry. Operating supply range is 4.5 V to 13.2 V. Decouple with a 1 μ F capacitor to GND. Ensure that this decoupling capacitor is placed near the IC.
7	COMP/ \overline{EN}	Compensation Pin. This is the output of the error amplifier (EA) and the non-inverting input of the PWM comparator. Use this pin in conjunction with the FB pin to compensate the voltage-control feedback loop. Pull this pin low for disable.
8	FB	This pin is the inverting input to the error amplifier. Use this pin in conjunction with the COMP pin to compensate the voltage-control feedback loop. Connect this pin to the output resistor divider (if used) or directly to V_{out} .
9	VOS	Offset voltage pin from V_{out} .
10	PGOOD	Power Good output. Open drain type output that is flagged low if $\pm 10\%$ of V_{out} .

ABSOLUTE MAXIMUM RATINGS

Pin Name	Symbol	V_{MAX}	V_{MIN}
Main Supply Voltage Input	V_{CC}	15 V	-0.3 V

Figure 6. OCP Threshold with 55k Rset vs. Temperature

APPLICATIONS INFORMATION

Overcurrent Protection (OCP)

The low-side $R_{DS(on)}$ sense is implemented by comparing the voltage at the LX, at the end of LG on time to an internally generated fixed voltage. If the phase voltage is lower than OCP trip voltage, an overcurrent condition occurs and a counter is initiated.

When the counter completes after two clock cycles, the PWM logic and both HS-FET and LS-FET are turned off. Power has to be recycled to exit out of the overcurrent fault. The minimum turn-on time of the LS-FET is set to be 500 ns.

NCP158x allows to easily program an Overcurrent Threshold ranging from 50 mV to 550 mV, simply by adding a resistor (ROCSET) between LG and GND. During a short period of time following V_{CC} rising over UVLO threshold, an internal 10 μ A current (IOCSET, trimmed to $\pm 5\%$) is sourced from LG pin, determining a voltage drop across ROCSET. This voltage drop will be sampled and internally held by the device as OverCurrent Threshold. The OC setting procedure overall time length is about 4.2 ms. Connecting a ROCSET resistor between LG and GND, the programmed threshold will be:

$$I_{OCth} = \frac{I_{OCSET} \cdot R_{OCSET}}{R_{DS(on)}}$$

RSET values range from 5 k Ω to 55 k Ω . In case ROCSET is not connected, the device switches the OCP threshold to a fixed 640 mV value: an internal safety clamp on BG is triggered as soon as LG voltage reaches 700 mV, enabling the 640 mV fixed threshold and ending OC setting phase. The current trip threshold tolerance is ± 25 mV. The accuracy of the set point is best at the highest set point. The accuracy will decrease as the set point decreases.

Internal Soft –Start

The NCP158x features an internal soft-start function, which reduces the inrush current and overshoot of the output voltage. Figure 7. shows a typical soft-start sequence. Soft-Start is achieved by ramping the internal reference using the oscillator clock (64 steps from 0 V to 0.8 V of V_{ref}). The order of startup sequence is as follows: UVLO \rightarrow OCP programming \rightarrow Comp voltage reach the lower end of the Ramp voltage (1.45 V). The typical soft-start time is 4.2 ms. The internal soft-start is held low when the part is in UVLO or Disable mode.

Power Good

Power Good is an open drain and active high output. This output can be pulled up high to the appropriate level with an external resistor. It monitors the output voltage through the VOS pin. The PGOOD is flagged low for $\pm 10\%$ of V_{out} for OV/UV trip points respectively. The separate VOS input is not slowed down by the compensation on the VFB pin. The PGOOD output can deliver a max of 4 mA sink current at 0.4 V when de-asserted. The PGOOD pin is held low during soft-start. Once soft-start is complete PGOOD goes high if there are no faults without any delays associated to it.

Undervoltage Protection

If the voltage at VOS pin drops below UV threshold, the device turns off both HS and LS MOSFETs, latching the condition. This requires a POR to recover.

Overvoltage Protection

If the voltage at VOS pin rises over OV threshold (1V typ), overvoltage protection turns off UG MOSFET and turns on LG MOSFET. The LG MOSFET will be turned off as soon as VOS goes below $V_{ref}/2$ (0.4 V). The condition is latched, and requires POR to recover. The device still controls the LG MOSFET and can switch it on whenever VOS rises above 1.0 V.

NCP1588, NCP1589

Figure 7. Typical Startup Sequence

NCP1588, NCP1589

Figure 8. Typical Power Good Function

Feedback and Compensation

The NCP158x allows the output voltage to be adjusted from 0.8 V to 5.0 V via an external resistor divider network. The controller will try to maintain 0.8 V at feedback pin. Thus, if a resistor divider circuit was placed across the feedback pin to V_{OUT} , the controller will regulate the output voltage proportional to the resistor divider network in order to maintain 0.8 V at the FB pin. The same formula applies to the VOS pin and the controller will maintain 0.8 V at the VOS pin.

Figure 9.

The relationship between the resistor divider network above and the output voltage is shown in the following equation:

$$R_4 = R_1 \times \left(\frac{V_{REF}}{V_{OUT} - V_{REF}} \right)$$

The same formula can be applied to the feedback resistors at VOS.

$$R_9 = R_{10} \times \left(\frac{V_{REF}}{V_{OUT} - V_{REF}} \right)$$

Design Example

Voltage Mode Control Loop with TYPE III Compensation

Converter Parameters:

Input Voltage: $V_{IN} = 5 \text{ V}$

Output Voltage: $V_{OUT} = 1.65 \text{ V}$

Switching Frequency: 300 kHz

Total Output Capacitance: $C_{OUT} = 3600 \mu\text{F}$

Total ESR: $\text{ESR} = 6 \text{ m}\Omega$

Output Inductance: $L_{OUT} = 1 \mu\text{H}$

Ramp Amplitude: $V_{RAMP} = 1.1 \text{ V}$

Figure 10.

a.. Set a target for the close loop bandwidth at $1/6^{\text{th}}$ of the switching frequency.

$$F_{\text{cross_over}} := 50 \text{ kHz}$$

NCP1588, NCP1589

b.. Output Filter Double Pole Frequency

$$F_{lc} := \frac{1}{2 \cdot \pi \cdot \sqrt{L_{OUT} \cdot C_{OUT}}}$$

$$F_{lc} = 2.653 \text{ kHz}$$

c.. ESR Zero Frequency:

$$F_{ESR} := \frac{1}{2 \cdot \pi \cdot C_{OUT} \cdot C_{ESR}}$$

$$F_{ESR} = 7.368 \text{ kHz}$$

Step 1: Set a value for R1 between 2 kΩ and 5 kΩ

$$R1 := 4.12 \text{ k}\Omega$$

Step 2: Pick compensation DC gain (R2/R1) for desired close loop bandwidth.

$$V_{RAMP} := 1.1 \text{ V}$$

$$R2 := R1 \cdot \left(\frac{V_{RAMP}}{V_{IN}} \right) \cdot \left(\frac{F_{cross_over}}{F_{lc}} \right)$$

$$R2 = 17.085 \text{ k}\Omega$$

Step 3: Place 1st zero at half the output filter double pole frequency.

$$C2 := \frac{2 \cdot \sqrt{L_{OUT} \cdot C_{OUT}}}{R2}$$

$$C2 = 7.024 \times 10^{-3} \mu\text{F}$$

Step 4: Place 1st pole at ESR zero frequency.

$$C1 := \frac{C2}{C2 \cdot R2 \cdot 2 \cdot \pi \cdot F_{ESR} - 1}$$

$$C1 = 1.542 \times 10^{-3} \mu\text{F}$$

Step 5: Place 2nd zero at the output filter double pole frequency.

$$R3 := \frac{R1}{\frac{F_{SW}}{2 \cdot F_{lc}} - 1}$$

$$R3 = 74.169 \Omega$$

Step 6: Place 2nd pole at half the switching frequency.

$$C3 := \frac{1}{(\pi \cdot R3 \cdot F_{SW})}$$

$$C3 = 0.014 \mu\text{F}$$

Step 7: R4 is sized to maintain the feedback voltage to $V_{ref} = 0.8 \text{ V}$.

$$R4 := \frac{V_{REF} \cdot R1}{V_{OUT} - V_{REF}}$$

$$R4 = 3.878 \text{ k}\Omega$$

The Component values for Type III Compensation are:

$$R1 = 4.12 \text{ k}\Omega$$

$$R2 = 17.085 \text{ k}\Omega$$

$$R3 = 74.169 \Omega$$

$$R4 = 3.878 \text{ k}\Omega$$

$$C1 = 0.0015 \mu\text{F}$$

$$C2 = 0.007 \mu\text{F}$$

$$C3 = 0.014 \mu\text{F}$$

NOTE: Recommend to change values to industry standard component values.
