

NCV48220

LDO Regulator - Very Low Quiescent Current, Charge Pump Boost Converter

150 mA

The NCV48220 is very low quiescent current 150 mA LDO regulator with integrated battery voltage charge pump boost converter for automotive applications requiring full functionality during battery voltage drop events (e.g. cranking). The NCV48220 require very low number of external components. Very low quiescent current as low as 35 μ A typical for NCV48220 makes it suitable for applications permanently connected to battery requiring very low quiescent current. The Enable function can be used for further decrease of quiescent current down to 1 μ A. The NCV48220 contains protection functions as current limit, thermal shutdown and reverse bias current protection.

Features

- Output Voltage: 5 V
- LDO Output Current: up to 150 mA
- Very Wide Input Voltage Operation Range: from 3 V to 40 V
- Very Low Quiescent Current: typ 35 μ A
- Enable Function (1.0 μ A max quiescent current when disabled)
- Microprocessor Compatible Control Functions:
 - ♦ Reset Output
- AEC-Q100 Grade 1 Qualified and PPAP Capable
- Protection Features:
 - ♦ Current Limitation
 - ♦ Thermal Shutdown
 - ♦ Reverse Bias Output Current
- This is a Pb-Free Device

Typical Applications

- Stop-Start Applications
- Instruments and Clusters
- Infotainment

DEFINITIONS

General

All measurements are performed using short pulse low duty cycle techniques to maintain junction temperature as close as possible to ambient temperature.

Output voltage

The output voltage parameter is defined for specific temperature, input voltage and output current values or specified over Line, Load and Temperature ranges.

Line Regulation

The change in output voltage for a change in input voltage measured for specific output current over operating ambient temperature range.

Load Regulation

The change in output voltage for a change in output current measured for specific input voltage over operating ambient temperature range.

Dropout Voltage

The input to output differential at which the regulator output no longer maintains regulation against further reductions in input voltage. It is measured when the output drops 100 mV below its nominal value. The junction temperature, load current, and minimum input supply requirements affect the dropout level.

Quiescent and Disable Currents

Quiescent Current (I_Q) is the difference between the input current (measured through the LDO input pin) and the output load current. If Enable pin is set to LOW the regulator reduces its internal bias and shuts off the output, this term is called the disable current (I_{DIS}).

Current Limit

Current Limit is value of output current by which output voltage drops below 96 % of its nominal value.

PSRR

Power Supply Rejection Ratio is defined as ratio of output voltage and input voltage ripple. It is measured in decibels (dB).

Line Transient Response

Typical output voltage overshoot and undershoot response when the input voltage is excited with a given slope.

Load Transient Response

Typical output voltage overshoot and undershoot response when the output current is excited with a given slope between low-load and high-load conditions.

Thermal Protection

Internal thermal shutdown circuitry is provided to protect the integrated circuit in the event that the maximum junction temperature is exceeded. When activated at typically 175°C, the regulator turns off. This feature is provided to prevent failures from accidental overheating.

Maximum Package Power Dissipation

The power dissipation level is maximum allowed power dissipation for particular package or power dissipation at which the junction temperature reaches its maximum operating value, whichever is lower.

APPLICATIONS INFORMATION

Circuit Description

The NCV48220 is an integrated low dropout regulator with integrated battery voltage charge pump boost converter that provides a regulated voltage at 150 mA to the output. Device is enabled with an input to the enable pin. The regulator voltage is provided by a PMOS pass transistor controlled by an error amplifier with a bandgap reference, which gives it the lowest possible dropout voltage. The output current capability is 150 mA, and the base drive quiescent current is controlled to prevent oversaturation when the input voltage is low or when the output is overloaded. Charge pump boost converter is active only during charge pump output voltage (input voltage of LDO) decreasing under charge pump operating activation threshold and inactive after input voltage increasing over charge pump operating deactivation threshold. Thermal shutdown occurs above 150°C to protect the IC during overloads and extreme ambient temperatures.

Regulator

The error amplifier compares the reference voltage to a sample of the output voltage (V_{out}) and drives the gate of a PMOS series pass transistor via a buffer. The reference is a bandgap design to give it a temperature-stable output. Saturation control of the PMOS is a function of the load current and input voltage. Oversaturation of the output power device is prevented, and quiescent current in the ground pin is minimized. Current limit and voltage monitors complement the regulator design to give safe operating signals to the processor and control circuits.

Regulator Stability Considerations

The input capacitor (C_{in}) and charge pump output capacitor (C_{CP}) is necessary to stabilize the input impedance to avoid voltage line influences. The output capacitor (C_{out}) helps determine three main characteristics of a linear regulator: startup delay, load transient response and loop stability. The capacitor value and type should be based on cost, availability, size and temperature constraints. The aluminum electrolytic capacitor is the least expensive solution, but, if the circuit operates at low temperatures (-25°C to -40°C), both the value and ESR of the capacitor will vary considerably. The capacitor manufacturer's data sheet usually provides this information. The value for the output capacitor C_{out} , shown in Figure 1 should work for most applications; see also Figure 13 for output stability at various load and Output Capacitor ESR conditions. Stable region of ESR in Figure 13 shows ESR values at which the LDO output voltage does not have any permanent oscillations at any dynamic changes of output load current. Marginal ESR is the value at which the output voltage waving is fully damped during four periods after the load change and no oscillation is further observable.

ESR characteristics were measured with ceramic capacitors and additional series resistors to emulate ESR.

Low duty cycle pulse load current technique has been used to maintain junction temperature close to ambient temperature.

List of recommended output capacitors:

GCM31CR71H225MA55 (2.2 μF , 50 V, X7R, 1206)
 GCM31CR71C335KA37 (3.3 μF , 16 V, X7R, 1206)
 GCM31CR71E475MA55 (4.7 μF , 25 V, X7R, 1206)
 GCM31CC71E106MA03 (10 μF , 25 V, X7S, 1206)
 KCM55WC71E107MH13 (100 μF , 25 V, X7S, 2220)

CGA5L3X7R1H225M (2.2 μF , 50 V, X7R, 1206)
 CGA5L1X7R1E335M (3.3 μF , 25 V, X7R, 1206)
 CGA5L1X7R1E475M (4.7 μF , 25 V, X7R, 1206)
 CGA5L1X7R1E106M (10 μF , 25 V, X7R, 1206)
 CKG57NX7S1C107M (100 μF , 16 V, X7S, 2220)

Charge Pump Capacitor Selection

Low ESR capacitors are necessary to minimize power losses, especially at high load current during active charge pump boost mode. The exact value of C_{FLY} and C_{CP} is not important. Charge pump output impedance (R_{out_CP}) is given by equation 1.

$$R_{out_CP} \approx 2 \times \Sigma(R_{sw}) + \frac{1}{f_{sw} \times C_{FLY}} + 4 \times ESR_{FLY} + ESR_{C_{CP}} \quad (\text{eq. 1})$$

Charge pump output voltage ripple is determined by the value of C_{CP} and the load current (I_{out}). C_{CP} is charged and discharged at a current roughly equal to the load current.

$$V_{ripple_CP} = \frac{I_{out}}{2 \times f_{sw} \times C_{CP}} \quad (\text{eq. 2})$$

This equation doesn't including the impact of non-overlap time and C_{CP} capacitor ESR. Since the output is not being driven during the non-overlap time, this time should be included in the ripple calculation. C_{CP} capacitor discharge time is approximately 60 % of a switching period

$$V_{ripple_CP} = I_{out} \times \left(\frac{0.6}{f_{sw} \times C_{CP}} + 2 \times ESR_{C_{CP}} \right) \quad (\text{eq. 3})$$

For example, with a 450 kHz switching frequency, a 10 μF C_{CP} capacitor with an ESR of 0.25 Ω and a 100 mA load the ripple voltage is 65 mV peak to peak.

Enable Input

The enable pin is used to turn the regulator on or off. By holding the pin below 0.8 V, the output of the regulator will be turned off. When the voltage on the enable pin is greater than 2.5 V, the output of the regulator will be enabled to power its output to the regulated output voltage. The enable pin may be connected directly to the input pin to give constant enable to the output regulator.

Thermal Considerations

As power in the NCV48220 increases, it might become necessary to provide some thermal relief. The maximum power dissipation supported by the device is dependent upon board design and layout. Mounting pad configuration on the PCB, the board material, and the ambient temperature affect the rate of junction temperature rise for the part. When the NCV48220 has good thermal conductivity through the PCB, the junction temperature will be relatively low with high power applications. The maximum dissipation the NCV48220 can handle is given by:

$$P_{D(MAX)} = \frac{[T_{J(MAX)} + T_A]}{R_{\Theta JA}} \quad (\text{eq. 4})$$

Since T_J is not recommended to exceed 150°C , then the NCV48220 soldered on 645 mm^2 , 1 oz copper area, FR4 can dissipate up to 1.2 W and up to 1.7 W for 4 layers PCB (all layers are 1 oz) when the ambient temperature (T_A) is 25°C . See Figure 28 for $R_{\Theta JA}$ versus PCB area.

Power dissipated is given by three main parts. The first is dependent on the charge pump boost mode activation. The second part including the power dissipated on LDO and the last represent current consumption.

CP active : $P_{D_CP1} = (2 \times V_{IN} - V_{CP}) \times I_{OUT}$ (eq. 5)

CP inactive : $P_{D_CP2} = \left(V_{IN} - V_{CP(\text{max. } V_{CP_LIM})} \right) \times I_{OUT}$ (eq. 6)

$P_{D_LDO} = \left(V_{CP(\text{max. } V_{CP_LIM})} - V_{OUT} \right) \times I_{OUT}$ (eq. 7)

$P_{D_Iq} = V_{in} \times \left(I_{q@I_{OUT}} \right)$ (eq. 8)

The power dissipated by the NCV48220 can be calculated from the following equations:

$P_{D1} = P_{D_CP1} + P_{D_LDO} + P_{D_Iq}$ (eq. 9)

$P_{D2} = P_{D_CP2} + P_{D_LDO} + P_{D_Iq}$ (eq. 10)

Figure 28. Thermal Resistance vs. PCB Copper Area

Hints

V_{in} and GND printed circuit board traces should be as wide as possible. When the impedance of these traces is high, there is a chance to pick up noise or cause the regulator to malfunction. Place external components, especially the output capacitor, as close as possible to the device and make traces as short as possible.

Place filter components as near as possible to the device to increase EMC performance.

Input Capacitor C_{in} is required if regulator is located far from power supply filter. If extremely fast input voltage transients are expected with slew rate in excess of $4\text{ V}/\mu\text{s}$ then appropriate input filter must be used. The filter can be composed of several capacitors in parallel.

DESCRIPTION:	SOIC-8 NB	PAGE 2 OF 2

onsemi and **onsemi** are trademarks of Semiconductor Components Industries, LLC dba **onsemi** or its subsidiaries in the United States and/or other countries. **onsemi** reserves the right to make changes without further notice to any products herein. **onsemi** makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does **onsemi** assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. **onsemi** does not convey any license under its patent rights nor the rights of others.

onsemi, **Onsemi**, and other names, marks, and brands are registered and/or common law trademarks of Semiconductor Components Industries, LLC dba "**onsemi**" or its affiliates and/or subsidiaries in the United States and/or other countries. **onsemi** owns the rights to a number of patents, trademarks, copyrights, trade secrets, and other intellectual property. A listing of **onsemi**'s product/patent coverage may be accessed at www.onsemi.com/site/pdf/Patent-Marking.pdf. **onsemi** reserves the right to make changes at any time to any products or information herein, without notice. The information herein is provided "as-is" and **onsemi** makes no warranty, representation or guarantee regarding the accuracy of the information, product features, availability, functionality, or suitability of its products for any particular purpose, nor does **onsemi** assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. Buyer is responsible for its products and applications using **onsemi** products, including compliance with all laws, regulations and safety requirements or standards, regardless of any support or applications information provided by **onsemi**. "Typical" parameters which may be provided in **onsemi** data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. **onsemi** does not convey any license under any of its intellectual property rights nor the rights of others. **onsemi** products are not designed, intended, or authorized for use as a critical component in life support systems or any FDA Class 3 medical devices or medical devices with a same or similar classification in a foreign jurisdiction or any devices intended for implantation in the human body. Should Buyer purchase or use **onsemi** products for any such unintended or unauthorized application, Buyer shall indemnify and hold **onsemi** and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that **onsemi** was negligent regarding the design or manufacture of the part. **onsemi** is an Equal Opportunity/Affirmative Action Employer. This literature is subject to all applicable copyright laws and is not for resale in any manner.
