

Self Protected Very Low I_q High Side Driver with Analog Current Sense

NCV84160

The NCV84160 is a fully protected single channel high side driver that can be used to switch a wide variety of loads, such as bulbs, solenoids, and other actuators. The device incorporates advanced protection features such as active inrush current management, over-temperature shutdown with automatic restart and an overvoltage active clamp. A dedicated Current Sense pin provides precision analog current monitoring of the output as well as fault indication of short to V_D , short circuit to ground and ON and OFF state open load detection. An active high Current Sense Disable pin allows all diagnostic and current sense features to be disabled.

Features

- Short Circuit Protection with Inrush Current Management
- CMOS (3 V / 5 V) Compatible Control Input
- Very Low Standby Current
- Very Low Current Sense Leakage
- Proportional Load Current Sense
- Current Sense Disable
- Off State Open Load Detection
- Output Short to V_D Detection
- Overload and Short to Ground Indication
- Thermal Shutdown with Automatic Restart
- Undervoltage Shutdown
- Integrated Clamp for Inductive Switching
- Loss of Ground and Loss of V_D Protection
- ESD Protection
- Reverse Battery Protection
- AEC-Q100 Qualified
- This is a Pb-Free Device

Typical Applications

- Switch a Variety of Resistive, Inductive and Capacitive Loads
- Can Replace Electromechanical Relays and Discrete Circuits
- Automotive / Industrial

FEATURE SUMMARY

Max Supply Voltage	V_D	41	V
Operating Voltage Range	V_D	4.5 to 28	V
R_{DSon} (max) $T_J = 25^\circ\text{C}$	R_{ON}	160	m Ω
Output Current Limit (typical)	I_{LIM}	12	A
OFF-state Supply Current (typical)	$I_{D(off)}$	0.01	μA

ELECTRICAL SPECIFICATIONS

Table 3. MAXIMUM RATINGS

Rating	Symbol	Value		Unit
		Min	Max	
DC Supply Voltage	V_D	-0.3	41	V
Peak Transient Input Voltage (Load Dump 46 V, $V_D = 14$ V, ISO16750-2: 2012 Test B)	V_{peak}		48	V
Input Voltage	V_{IN}	-10	10	V
Input Current	I_{IN}	-5	5	mA
Reverse Ground Pin Current	I_{GND}		-200	mA
Output Current (Note 2)	I_{OUT}	-6	Internally Limited	A
CS Current	I_{CS}		200	mA
CS Voltage	V_{CS}	$V_D - 41$	V_D	V
CS_DIS Voltage	V_{CS_DIS}	-10	10	V
CS_DIS Current	I_{CS_DIS}	-5	5	mA
Power Dissipation $T_c = 25^\circ\text{C}$ (Note 4)	P_{tot}	1.49		W
Electrostatic Discharge (HBM Model 100 pF / 1500 Ω)	V_{ESD}			DC
Input		4		kV
Current Sense		3		kV
Current Sense Enable		4		kV
Output		3		kV
V_D		3		kV
Charge Device Model CDM-AEC-Q100-011		750		V
Single Pulse Inductive Load Switching Energy (Note 1) ($L = 8$ mH, $V_{bat} = 13.5$ V; $I_L = 3.08$ A, $T_{J_Start} = 150^\circ\text{C}$)	E_{AS}		53.71	mJ
Operating Junction Temperature	T_J	-40	+150	$^\circ\text{C}$
Storage Temperature	$T_{storage}$	-55	+150	$^\circ\text{C}$

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Not subjected to production testing
2. Reverse Output current has to be limited by the load to stay within absolute maximum ratings and thermal performance.

Table 4. THERMAL RESISTANCE RATINGS

Parameter	Symbol	Max. Value	Units
Thermal Resistance			$^\circ\text{C/W}$
Junction-to-Lead	$R_{\theta JL}$	32	
Junction-to-Ambient (Note 3)	$R_{\theta JA}$	98	
Junction-to-Ambient (Note 4)	$R_{\theta JA}$	84

7. Not subjected to production testing.

8. To ensure long term reliability during overload or short circuit conditions, protection and related diagnostic signals must be used together with a fitting hardware & software strategy. If the device operates under abnormal conditions, this hardware & software solution must limit the duration and number of activation cycles.

3b		A			
Class	Functional Status				
A	All functions of a device perform as designed during and after exposure to disturbance.				
B	All functions of a device perform as designed during exposure. However, one or more of them can go beyond specified tolerance. All functions return automatically to within normal limits after exposure is removed. Memory functions shall remain class A.				
C	One or more functions of a device do not perform as designed during exposure but return automatically to normal operation after exposure is removed.				
D	One or more functions of a device do not perform as designed during exposure and do not return to normal operation until exposure is removed and the device is reset by simple "operator/use" action.				
E	One or more functions of a device do not perform as designed during and after exposure and cannot be returned to proper operation without replacing the device.				

Application Information

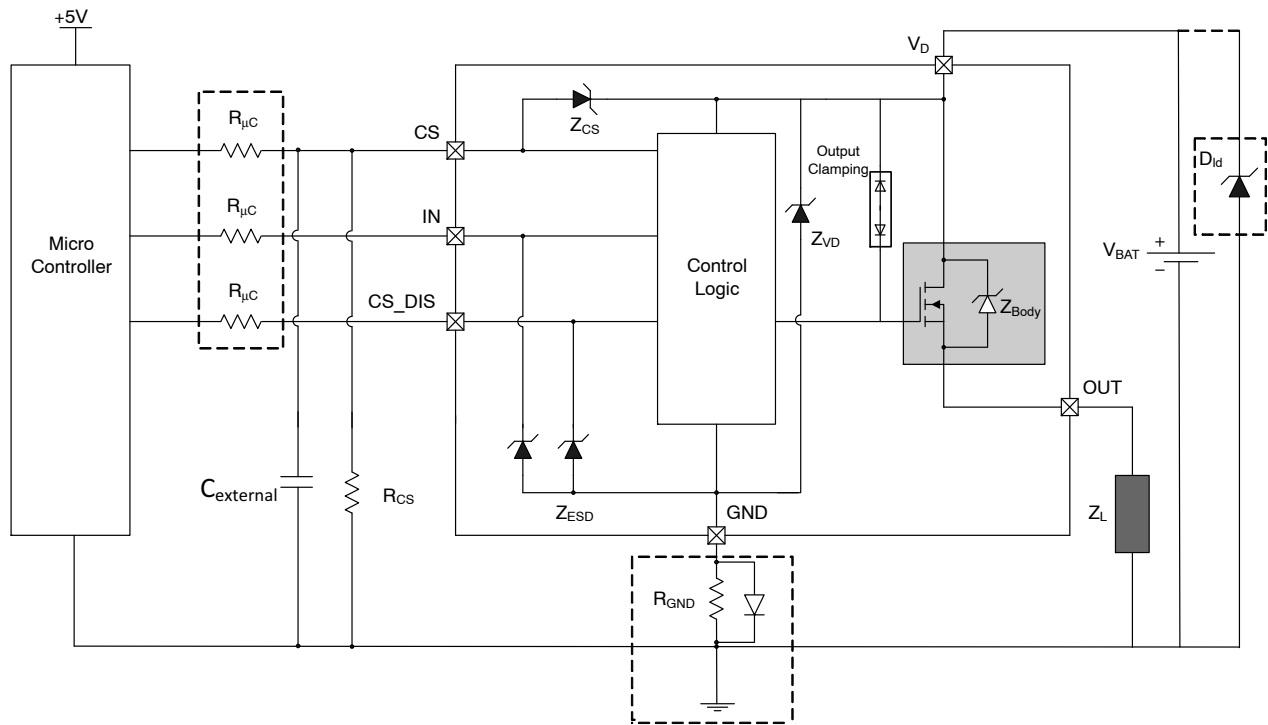

Figure 33. Application Schematic

Loss of Ground Protection

When device or ECU ground connection is lost and load is still connected to ground, the device will turn the output OFF. In loss of ground state, the output stage is held OFF independent of the state of the input. Input resistors are recommended between the device and microcontroller.

Reverse Battery Protection

Solution 1: Resistor in the GND line only (no parallel Diode)

The following calculations are true for any type of load.

In the case for no diode in parallel with R_{GND} , the calculations below explain how to size the resistor.

Consider the following parameters: $-I_{GND}$ Maximum = 200 mA for up to $-V_D = 32$ V.

Where $-I_{GND}$ is the DC reverse current through the GND pin and $-V_D$ is the DC reverse battery voltage.

$$-I_{GND} = \frac{-V_D}{R_{GND}} \quad (\text{eq. 1})$$

Since this resistor can be used amongst multiple High-Side devices, please take note the sum of the maximum active GND currents ($I_{GND(On)max}$) for each device when sizing the resistor. Please note that if the microprocessor GND is not shared by the device GND, then R_{GND} produces a shift of ($I_{GND(On)max} * R_{GND}$) in the input thresholds and CS output values. If the calculated power dissipation leads to too large of a resistor size or several devices have to share the same resistor, please look at the second solution for Reverse Battery Protection. Refer to the figure below for selecting the proper R_{GND} .

NCV84160 Reverse Battery Considerations
Normal Operation VIN = 5 V, Reverse Battery = 32 V

Figure 34. Reverse Battery R_{GND} Considerations

Solution 2: Diode (D_{GND}) in parallel with R_{GND} in the ground line.

A resistor value of $R_{GND} = 1 \text{ k}\Omega$ should be selected and placed in parallel to D_{GND} if the device drives an inductive load. The diode (D_{GND}) provides a ~600–700 mV shift in the input threshold and current sense values if the micro controller ground is not common to the device ground. This shift will not vary even in the case of multiple high-side devices using the same resistor/diode network.

Undervoltage Protection

The device has two under-voltage threshold levels, V_{D_MIN} and V_{UV} . Switching function (ON/OFF) requires supply voltage to be at least V_{D_MIN} . The device features a lower supply threshold V_{UV} , above which the output can remain in ON state. While all protection functions are guaranteed when the switch is ON, diagnostic functions are operational only within nominal supply voltage range V_D .

Figure 35. Undervoltage Behavior

Overvoltage Protection

The NCV84160 has two Zener diodes ZV_D and ZCS , which provide integrated overvoltage protection. ZV_D protects the logic block by clamping the voltage between supply pin V_D and ground pin GND to VZV_D . ZCS limits voltage at current sense pin CS to $V_D - VZCS$. The output power MOSFET's output clamping diodes provide protection by clamping the voltage across the MOSFET (between V_D pin and OUT pin) to $VCLAMP$. During overvoltage protection, current flowing through ZV_D , ZCS and the output clamp must be limited. Load impedance ZL limits the current in the body diode $ZBody$. In order to limit the current in ZV_D a resistor, $RGND$ (150 Ω), is required in the GND path. External resistors RCS and $RSENSE$ limit the current flowing through ZCS and out of the CS pin into the micro-controller I/O pin. With $RGND$, the GND pin voltage is elevated to $V_D - VZV_D$ when the supply voltage V_D rises above VZV_D . ESD diodes $ZESD$ pull up the voltage at logic pins IN, CS_Dis close to the GND pin voltage $V_D - VZV_D$. External resistors RIN , and RCS_DIS are required to limit the current flowing out of the logic pins into the micro-controller I/O pins. During overvoltage exposure, the device transitions into a self-protection state, with automatic recovery after the supply voltage comes back to the normal operating range. The specified parameters as well as short circuit robustness and energy capability cannot be guaranteed during overvoltage exposure.

Overload Protection

Current limitation as well as over-temperature shutdown mechanisms are integrated into the NCV84160 to provide protection from overload conditions such as bulb inrush or short to ground.

Current Limitation

In case of overload, the NCV84160 limits the current in the output power MOSFET to a safe value. Due to high power dissipation during current limitation, the device's junction temperature increases rapidly. In order to protect the device, the output driver is shut down by one of the two over-temperature protection mechanisms. The output current limitation level is dependent on the drain-to-source voltage of the power MOSFET. If the input remains active during the shutdown, the output power MOSFET will automatically be re-activated after a minimum OFF time or when the junction temperature returns to a safe level.

Output Clamping with Inductive Load Switch Off:

The output voltage V_{OUT} drops below GND potential when switching off inductive loads. This is because the inductance develops a negative voltage across the load in response to a decaying current. The integrated clamp of the device clamps the negative output voltage to a certain level relative to the supply voltage V_{BAT} . During output clamping with inductive load switch off, the energy stored in the inductance is rapidly dissipated in the device resulting in high power dissipation. This is a stressful condition for the device and the maximum energy allowed for a given load inductance should not be exceeded in any application.

Figure 36. Inductive Load Switching

Figure 37. Maximum Switch-Off Current vs. Load Inductance, $V_D = 13.5\text{ V}$; $R_L = 0\ \Omega$

Open Load Detection in OFF State

Open load diagnosis in the OFF-state can be performed by activating an external resistive pull-up path (RPU) to VBAT. To calculate the pull-up resistance, external leakage

currents (designed pull-down resistance, humidity-induced leakage etc) as well as the open load threshold voltage VOL have to be taken into account.

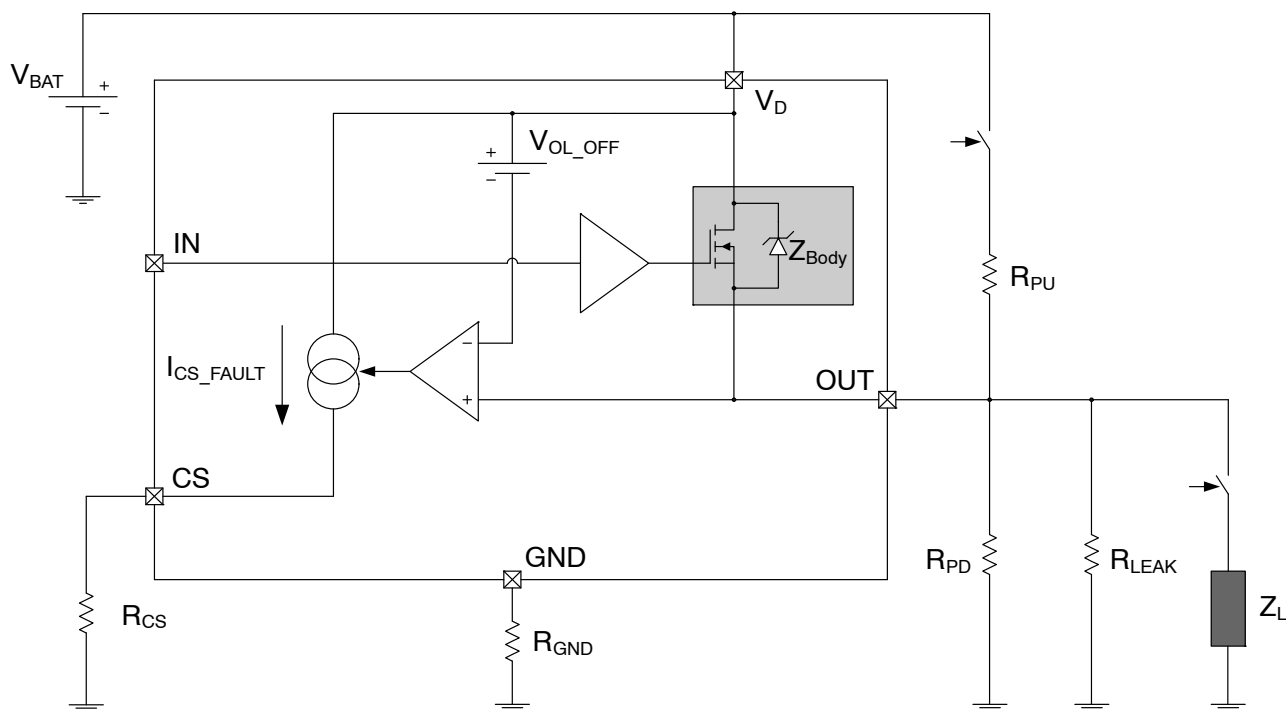

Figure 38. Off State Open Load Detection Circuit

Current Sense in PWM Mode

While operating in PWM mode, the current sense functionality can be used, but the timing of the input signal and the response time of the current sense need to be considered. When operating in PWM mode, the following performance is to be expected. The CS_DIS pin should be left low to eliminate any unnecessary delay time to the circuit. When V_{IN} switches from low to high, there will be

a typical delay (tCS_High2) before the current sense responds. Once this timing delay has passed, the rise time of the current sense output (ΔtCS_High2) also needs to be considered. When V_{IN} switches from high to low a delay time (tCS_Low1) needs to be considered. As long as these timing delays are allowed, the current sense pin can be operated in PWM mode.

NOTES:

1. DIMENSIONING AND TOLERANCING PER ANSI Y14.5M, 1982.
2. CONTROLLING DIMENSION: MILLIMETER.
3. DIMENSION A AND B DO NOT INCLUDE MOLD PROTRUSION.
4. MAXIMUM MOLD PROTRUSION 0.15 (0.006) PER SIDE.
5. DIMENSION D DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL BE 0.127 (0.005) TOTAL IN EXCESS OF THE D DIMENSION AT MAXIMUM MATERIAL CONDITION.
6. 751-01 THRU 751-06 ARE OBSOLETE. NEW STANDARD IS 751-07.
