

NOA1213

Ambient Light Sensor with Dark Current Compensation

Description

The NOA1213 is a very low power ambient light sensor (ALS) with an analog current output and a power down mode to conserve power. Designed primarily for handheld device applications, the active power dissipation of this chip is less than 8 μA at dark and its quiescent current consumption is less than 200 pA in power down mode. The device can operate over a very wide range of voltages from 2 V to 5.5 V. The NOA1213 employs proprietary CMOS image sensing technology from ON Semiconductor, including built-in dynamic dark current compensation to provide large signal to noise ratio (SNR) and wide dynamic range (DR) over the entire operating temperature range. The photopic optical filter provides a light response similar to that of the human eye. Together the photopic light response and dark current compensation insures accurate light level detection.

Features

- Senses Ambient Light and Provides an Output Current Proportional to the Ambient Light Intensity
- Photopic Spectral Response
- Dynamic Dark Current Compensation
- Three Selectable Output Current Gain Modes in Approximately 10x Steps
- Power Down Mode
- Less than 14 μA at 100 lux Active Power Consumption in Medium Gain Mode (Less than 8 μA at Dark)
- Less than 200 pA Quiescent Power Dissipation in Power Down Mode at All Light Levels
- Linear Response Over the Full Operating Range
- Senses Intensity of Ambient Light from ~0 lux to Over 100,000 lux
- Wide Operating Voltage Range (2 V to 5.5 V)
- Wide Operating Temperature Range (-40°C to 85°C)
- Drop-in Replacement Device in 1.6 x 1.6 mm Package
- These Devices are Pb-Free, Halogen Free/BFR Free and are RoHS Compliant

Applications

- Saves display power in applications such as:
 - ◆ Cell Phones, PDAs, MP3 players, GPS
 - ◆ Cameras, Video Recorders
 - ◆ Mobile Devices with Displays or Backlit Keypads
 - ◆ Laptops, Notebooks, Digital Signage
 - ◆ LCD TVs and Monitors, Digital Picture Frames
 - ◆ Automobile Dashboard Displays and Infotainment
 - ◆ LED Indoor/Outdoor Residential and Street Lights

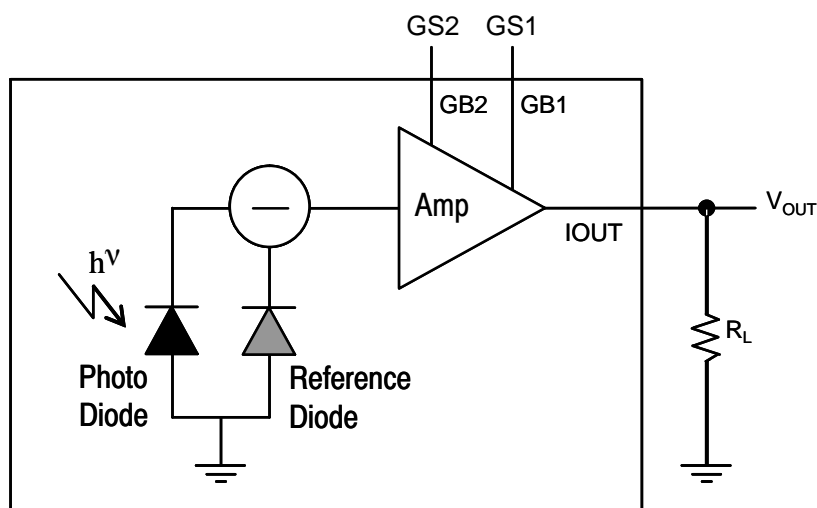

Figure 2. Simplified Block Diagram

Table 1. PIN FUNCTION DESCRIPTION

Pin	Pin Name	Description
1	VDD	Power pin.
2	VSS	Ground pin.
3	GB1	In conjunction with GB2, selects between three gain modes and power down.
4	GB2	In conjunction with GB1, selects between three gain modes and power down.
5	NC	Not connected. This may be connected to ground or left floating.
6	IOOUT	Analog current output.
EP	VSS	Exposed pad, internally connected to ground. Should be connected to ground.

Table 2. ABSOLUTE MAXIMUM RATINGS

Rating	Symbol	Value	Unit
Input power supply	V_{DD}	6	V
Input voltage range	V_{IN}	-0.3 to $V_{DD} + 0.3$	V
Output voltage range	V_{OUT}	-0.3 to $V_{DD} + 0.2$	V
Output current range	I_o	0 to 15	mA
Maximum Junction Temperature	$T_{J(max)}$	-40 to 85	°C
Storage Temperature	T_{STG}	-40 to 85	°C
ESD Capability, Human Body Model (Note 1)	ESD_{HBM}	2	kV
ESD Capability, Charged Device Model (Note 1)	ESD_{CDM}	750	V
ESD Capability, Machine Model (Note 1)	ESD_{MM}	150	V
Moisture Sensitivity Level	MSL	3	—
Lead Temperature Soldering (Note 2)	T_{SLD}	260	°C

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. This device incorporates ESD protection and is tested by the following methods:

ESD Human Body Model tested per EIA/JESD22-A114

ESD Charged Device Model tested per ESD-STM5.3.1-1999

ESD Machine Model tested per EIA/JESD22-A115

Latchup Current Maximum Rating: ≤ 100 mA per JEDEC standard: JESD78

2. For information, please refer to our Soldering and Mounting Techniques Reference Manual, SOLDERRM/D

Table 3. ELECTRICAL CHARACTERISTICS(Unless otherwise specified, these specifications apply over $V_{DD} = 5.5\text{ V}$, $-40^{\circ}\text{C} < T_A < 85^{\circ}\text{C}$)

Rating	Test Conditions	Symbol	Min	Typ	Max	Unit
Power supply voltage		V_{DD}	2	3.0	5.5	V
Power supply current	$V_{DD} = 3.0\text{ V}$, $E_v = 0\text{ lux}$, H-Gain	I_{DD_0}	6	8	12	μA
Power supply current	$V_{DD} = 3.0\text{ V}$, $E_v = 100\text{ lux}$, H-Gain	I_{DD_100}	35	45	55	μA
Power down current	All light levels	I_{DD_PD}		0.2	5	nA
Output current, high-gain	$E_v = 100\text{ lux}$, White LED	I_{o_high}	23.8	34	44.3	μA
Dark output current, high-gain	$V_{DD} = 3.0\text{ V}$, $E_v = 0\text{ lux}$	I_{o_dark}		10		nA
Wavelength of maximum response		λ_m		590		nm
White LED/fluorescent current ratio	$E_v = 100\text{ lux}$	r_{LE}		1.0		
Incandescent/fluorescent current ratio	$E_v = 100\text{ lux}$	r_{IF}		0.83		
Maximum output voltage	$E_v = 100\text{ lux}$, $R_L = 220\text{ k}\Omega$, H-Gain	V_{OMAX}	$V_{DD}-0.4$	$V_{DD}-0.1$	V_{DD}	V
Power down time	$E_v = 100\text{ lux}$, H-Gain to PD	t_{PD}	1.5			ms
Wake up time	$E_v = 100\text{ lux}$, PD to H-Gain	t_{wu}			300	μs
Low level input voltage		V_{IL}	-0.2		$0.25 V_{DD}$	V
High level input voltage		V_{IH}	$0.75 V_{DD}$		$V_{DD}+0.2$	V
Operating free-air temperature range		T_A	-40		85	$^{\circ}\text{C}$

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

DESCRIPTION OF OPERATION

Ambient Light Sensor Architecture

The NOA1213 employs a sensitive photo diode fabricated in ON Semiconductor's standard CMOS process technology. The major components of this sensor are as shown in Figure 2. The photons which are to be detected pass through an ON Semiconductor proprietary color filter limiting extraneous photons and thus performing as a band pass filter on the incident wave front. The filter only

transmits photons in the visible spectrum which are primarily detected by the human eye and exhibits excellent IR rejection. The photo response of this sensor is as shown in Figure 3.

The ambient light signal detected by the photo diode is converted to an analog output current by an amplifier with programmable gain. Table 4 shows the gain setting and the corresponding light sensitivity.

Table 4. PROGRAMMABLE GAIN SETTINGS

GB2	GB1	Mode	Approximate Output Current @ 100 lux	Approximate Output Current @ 1000 lux	Saturation
0	0	Power Down	–	–	–
0	1	High Gain	34.1 μ A	365 μ A	~10,000 lux
1	0	Medium Gain	3.56 μ A	37.3 μ A	~100,000 lux
1	1	Low Gain	0.387 μ A	4.19 μ A	> 100,000 lux

Power Down Mode

This device can be placed in a power down mode by setting GB1 and GB2 to logic low level.

In order for proper operation of this mode GB1 and GB2 should stay low 1.5 ms.

External Component Selection

The NOA1213 outputs a current in direct response to the incident illumination. In many applications it is desirable to convert the output current into voltage. It may also be desirable to filter the effects of 50/60 Hz flicker or other light source transients.

Conversion from current to voltage may be accomplished by adding load resistor R_L to the output. The value of R_L is bounded on the high side by the potential output saturation of the amplifier at high ambient light levels. R_L is bounded on the low side by the output current limiting of the internal amplifier and to minimize power consumption.

Equation 1 describes the relationship of light input to current output for the High-Gain mode.

$$I_{OUT} = (34.5 \mu\text{A}/100 \text{ lux}) * E_V \quad (\text{eq. 1})$$

By adding R_L to the output, I_{OUT} is converted into a voltage according to Equation 2.

$$V_{OUT} = I_{OUT} * R_L = (34.5 \mu\text{A}/100 \text{ lux}) * E_V * R_L \quad (\text{eq. 2})$$

The range of the output voltage is limited by the output stage to the V_{OMAX} parameter value of $V_{DD} - 0.4 \text{ V}$ at the

maximum desired E_V as shown in Equation 3. Equation 4 computes the value for R_L (High-Gain mode).

$$V_{OMAX} = (34.5 \mu\text{A}/100 \text{ lux}) * E_{VMAX} * R_L \quad (\text{eq. 3})$$

$$R_L = (V_{DD} - 0.4 \text{ V})/E_{VMAX} * (100 \text{ lux}/34.5 \mu\text{A}) \quad (\text{eq. 4})$$

For example, consider a 5 V supply with a desired $E_{VMAX} = 1000 \text{ lux}$, the value of R_L would be 13.3 k Ω . The value for R_L can easily be computed for different NOA1213 gain ranges by substituting the appropriate output current at 100 lux from Table 4.

The optional capacitor C_L can be used to form a low-pass filter to remove 50/60 Hz filter or other unwanted noise sources as computed with Equation 5.

$$C_L = 1/2\pi f_c R_L \quad (\text{eq. 5})$$

For our example, to filter out 60Hz flicker the value of C_L would be 200 nF.

Power Supply Bypassing and Printed Circuit Board Design

Power supply bypass and decoupling can typically be handled with a low cost 0.1 μ F to 1.0 μ F capacitor.

The exposed pad on the bottom of the package is internally connected to VSS pin 2 and should be soldered to the printed circuit board.

NOTE: Oblique illumination with IR light can disrupt normal operation. Please request App Note "Known NOA1213CUTAG Performance Aberrations" for more details.
