EVAL BOARD USER'S MANUAL

Description

The NCV890104 is a fixed-frequency, monolithic, Buck switching regulator intended for Automotive, battery-connected applications that must operate with up to a 36 V input supply. The regulator is suitable for systems with low noise and small form factor requirements often encountered in automotive driver information systems. The NCV890104 is capable of converting the typical 4.5 V to 18 V automotive input voltage range to outputs as low as 3.3 V at a constant switching frequency above the sensitive AM band, eliminating the need for costly filters and EMI countermeasures. A Reset pin signals when the output is in regulation, and a pin is provided to adjust the delay before the RSTB signal goes high. The NCV890104 also provides several protection features expected in Automotive power supply systems such as current limit, short circuit protection, and thermal shutdown. In addition, the high switching frequency produces low output voltage ripple even when using small inductor values and an all-ceramic output filter capacitor – forming a space-efficient switching regulator solution.

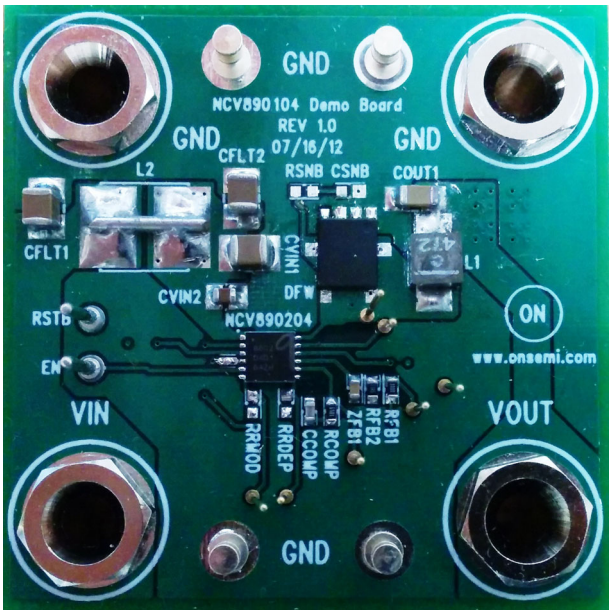

Figure 1. NCV890104 Evaluation Board

Key Features

- Internal N-channel Power Switch
- Low V_{IN} Operation Down to 4.5 V
- High V_{IN} Operation to 36 V
- Withstands Load Dump to 40 V
- 2 MHz Free-running Switching Frequency
- Adjustable Spread Spectrum
- Reset with Adjustable Delay
- Logic level Enable Input Can be Directly Tied to Battery
- 1.4 A (min) Cycle-by-Cycle Peak Current Limit
- Short Circuit Protection enhanced by Frequency Foldback
- ±1.75% Output Voltage Tolerance
- Output Voltage Adjustable Down to 0.8 V
- 1.4 Millisecond Internal Soft-Start
- Thermal Shutdown (TSD)
- Low Shutdown Current
- NCV Prefix for Automotive and Other Applications Requiring Unique Site and Control Change Requirements; AEC−Q100 Qualified and PPAP Capable
- Wettable Flanks DFN (Pin Edge Plating)
- These Devices are Pb-Free and are RoHS Compliant

Typical Applications

- Audio, Infotainment, Safety – Vision Systems, Instrumentation

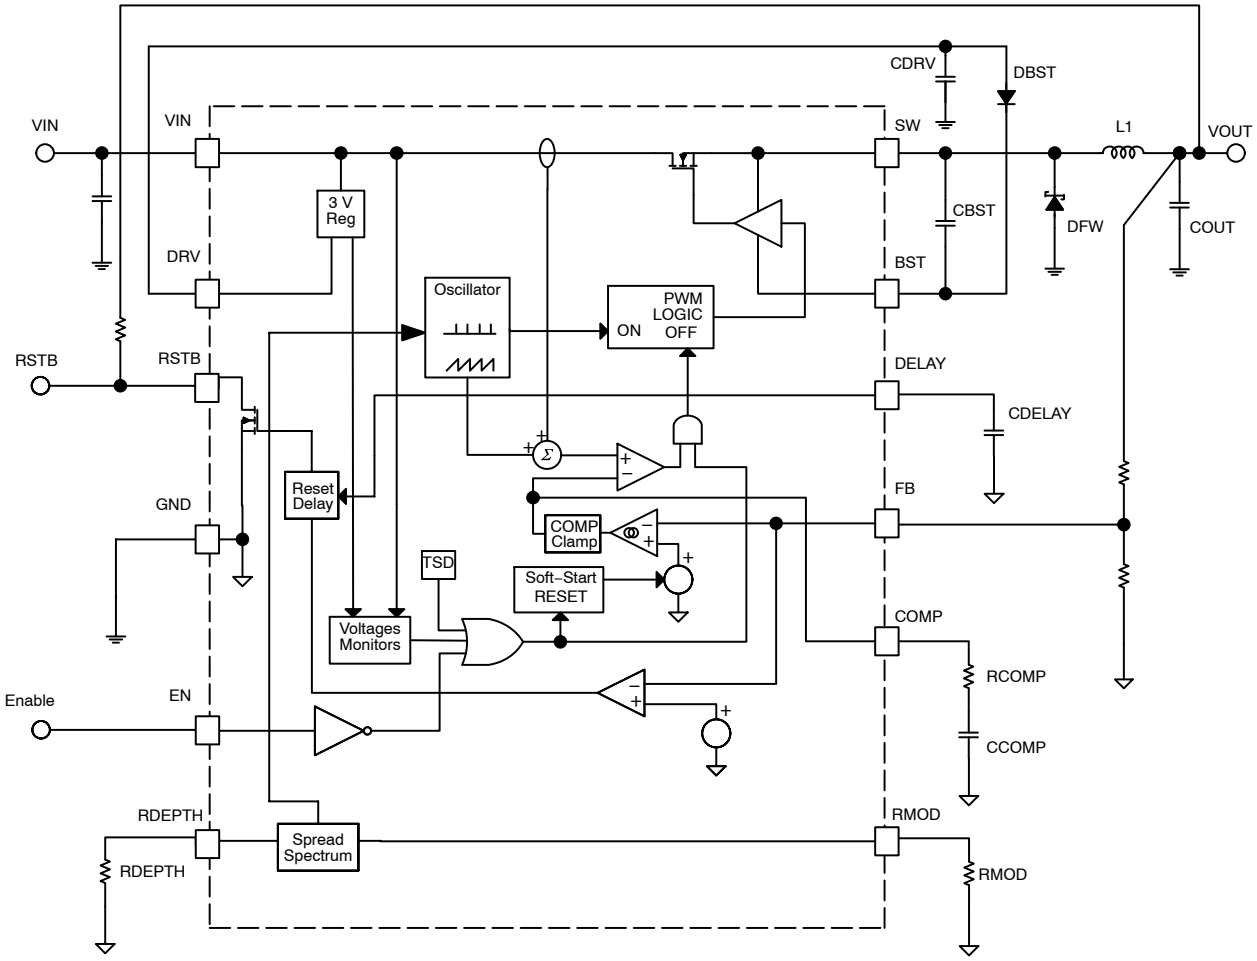

Figure 2. NCV890104 Block Diagram

TYPICAL APPLICATION

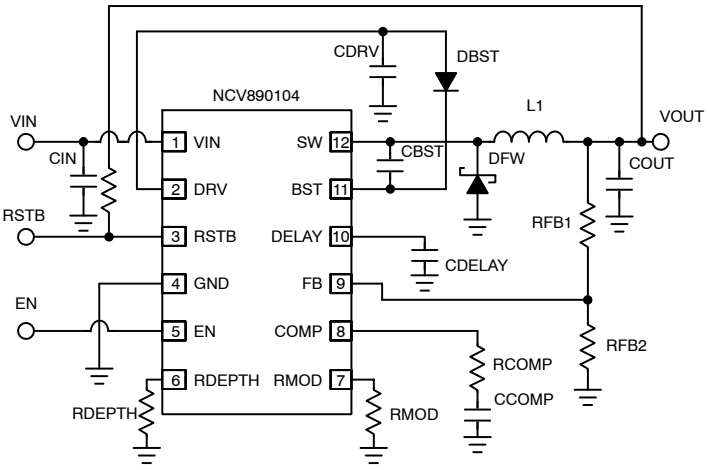

Figure 3. Typical Application

Table 1. EVALUATION BOARD TERMINALS

Pin Name	Function
VIN	Positive dc Input Voltage
GND	Common dc Return
VOUT	Positive dc Output Voltage
EN	Master Enable Input
RST3B	Reset with Adjustable Delay

Table 2. ABSOLUTE MAXIMUM RATINGS (Voltages are with respect to GND)

Rating	Value	Unit
Dc Supply Voltage (VIN, EN)	−0.3 to 40	V
Dc Supply Voltage (RSTB)	−0.3 to 6	V
Storage Temperature Range	−55 to +150	°C

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

Table 3. ELECTRICAL CHARACTERSITICS

Characteristic	Conditions	Typical Value	Unit
REGULATION			
Output Voltage (VOUT)		5.0	V
Line Regulation (VOUT)	I_{OUT} = 1.0 A	0.1	%
Load Regulation (VOUT)	V_{IN} = 13.2 V	0.1	%
SWITCHING			
Switching Frequency		2.0	MHz
Soft-start Time		1.4	ms
CURRENT LIMIT			
Peak Current Limit (VOUT)	EN = 5 V	2.35	A
PROTECTIONS			
Input Undervoltage Lockout (UVLO)	V_{IN} Decreasing	3.4	V
Thermal Shutdown	T_J Rising	170	°C

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

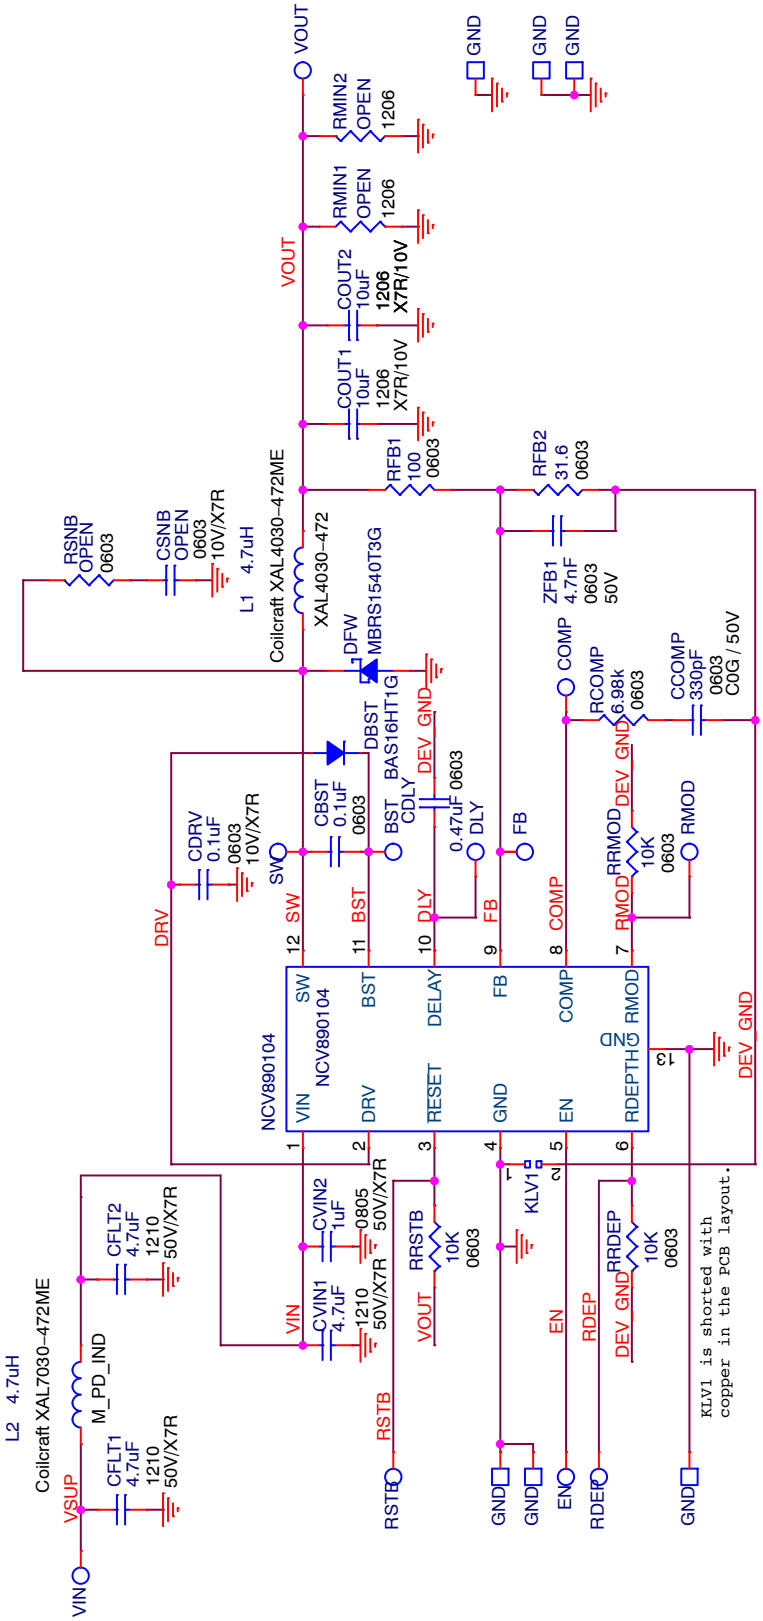

Figure 4. NCV890104GEVB Evaluation Board Schematic

OPERATIONAL GUIDELINES

1. Connect a dc input voltage, within the 6.0 V to 36 V range, between VIN and GND.
2. Connect a dc enable voltage, within the 2.0 V to 36 V range, between EN and GND. This will power up the switcher. The VOUT signal should be 3.3 V.
3. Add a load to VOUT – up to 1.0 A.

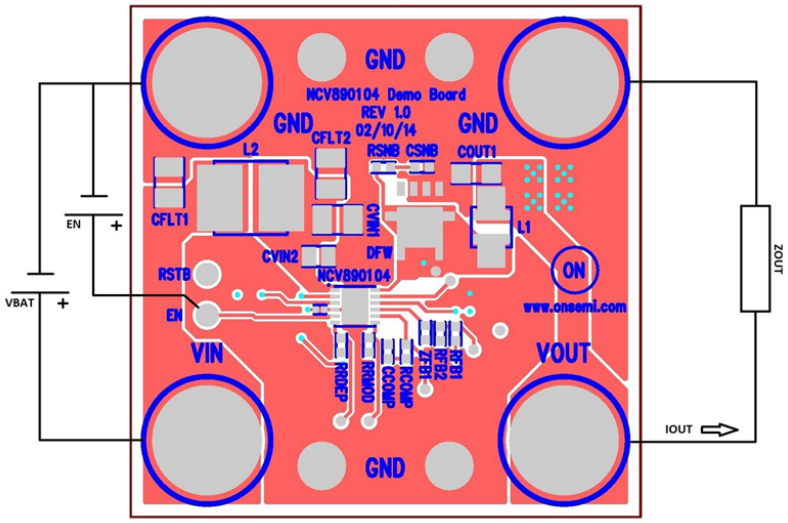

Figure 5. NCV890104 Board Connections

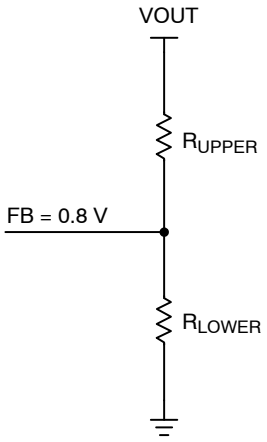
ADDITIONAL GUIDELINES

Output Voltage Selection

The voltage output for the switcher is adjustable and can be set with a resistor divider. The FB reference for the switcher is 0.8 V.



Use the following equation:

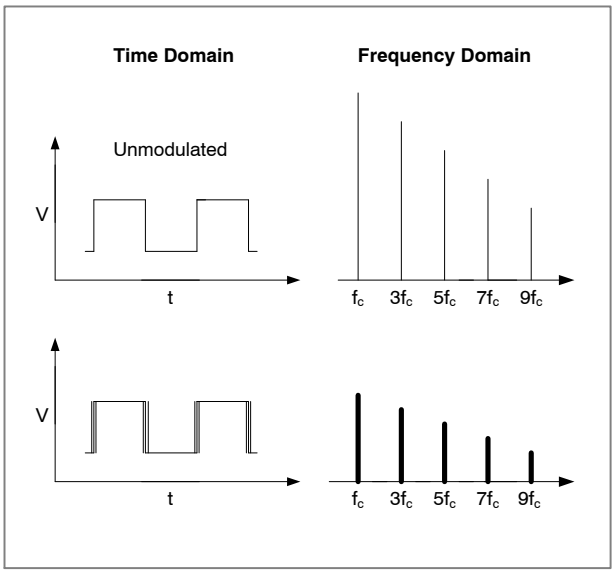
$$R_{UPPER} = R_{LOWER} \frac{V_{OUT} - V_{FB}}{V_{FB}}$$

Some common setups are listed below:

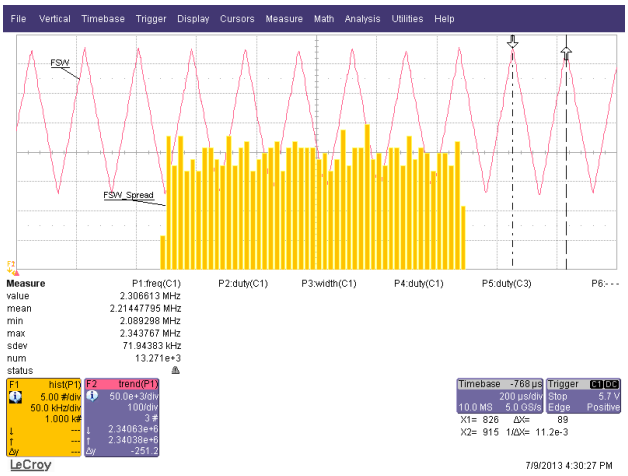
Desired Output (V)	VREF (V)	R_{UPPER} (kΩ, 1%)	R_{LOWER} (kΩ, 1%)
1.2	0.8	5.11	10.0
1.5	0.8	8.87	10.0
1.8	0.8	12.7	10.0
2.5	0.8	21.5	10.0
3.3	0.8	31.6	10.0
5.0	0.8	52.3	10.0

Spread Spectrum

In SMPS devices, switching translates to higher efficiency. Unfortunately, the switching leads to a much noisier EMI profile. We can greatly decrease some of the radiated emissions with some spread spectrum techniques. Spread spectrum is used to reduce the peak electromagnetic emissions of a switching regulator.



The spread spectrum used in the NCV890104 is an “up-spread” technique, meaning the switching frequency is spread upward from the 2.0 MHz base frequency. For example, a 5 % spread means that the switching frequency is swept (spread) from 2.0 MHz up to 2.1 MHz in a linear fashion – this is called the modulation depth. The rate at which this spread takes place is called the modulation frequency. For example, a 10 kHz modulation frequency means that the frequency is swept from 2.0 MHz to 2.1 MHz in 50 µs and then back down from 2.1 MHz to 2.0 MHz in 50 µs.



The modulation depth and modulation frequency are each set by an external resistor to GND. The modulation frequency can be set from 5 kHz up to 50 kHz using a resistor from the RMOD pin to GND. The modulation depth can be set from 3% up to 30% of the nominal switching frequency using a resistor from the RDEPTH pin to GND. Please see the curves below for typical values:

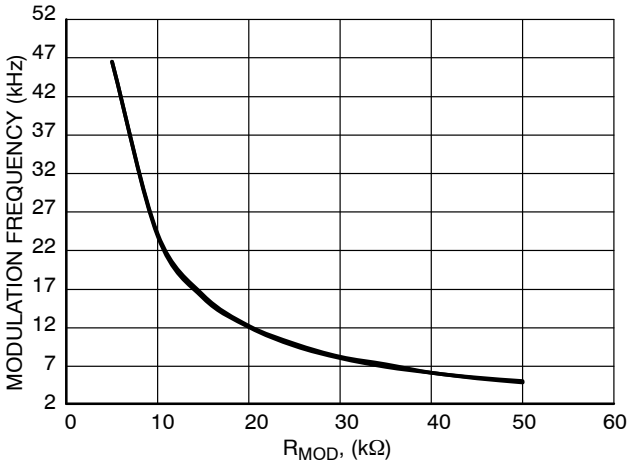


Figure 6. Modulation Frequency vs. RMOD Value

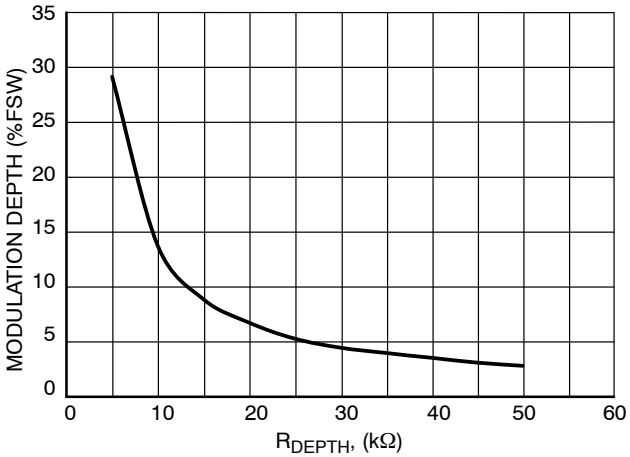

Figure 7. Modulation Depth vs. RDEPTH Value

Spread spectrum is automatically turned off when there is a short to GND or an open circuit on either the RMOD pin or the RDEPTH pin. Please be sure that the ROSC pin is an open circuit when using spread spectrum.
